                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                쉽
                                                                                                                                                                                                                                                                                                                                                                                                                     candidate in its interest their primary source of carbohydrate. Monocytedonous rice is a diploid plant (2n-24) with a haploid genome equivalent of 431 Mbp (Arnunganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare: variety. The library contains 30, 864 clones with an average lasert size of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 % Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening.*
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota; Viridiplantae, Streptophyta; Embryophyta; Tracheophyta; euphyllophytes; Spermatophyta; Magnollophyta; Lillopsida; Poales;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                available on the World Wide Web.

(UKL, http://www.sanger.ac.uk/Projects/A_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of postitional base preference in codons, especially where there is an increase in the observed/expected third position G + C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cole, S.T., Brosch, R., Parkhill, J., Garnler, T., Churcher, C., Barris, D., Gordon, S.V., Eiglmeler, R., Gas, S., Barry III, C.E., Tektais, F., Badcock, K., Basham, D., Chillingworth, T., Connor, R., Davies, R., Deviln, K., Feltwell, T., Gentles, S., Bantin, N., Bolroyd, S., Horneby, T., Tagels, K., Krogh, A., McLean, J., Moule, S., Nurphy, L., Oliver, S., Osborne, J., Quall, M.A.,

TITLE The sequence of IAC TUPBH12 from Arabidopsis thaliana chromosome I JODERNAL. Uppublished (1997) REMARK. We have determined that YAC yUPBH12 is chimaeric, and is comprised of two distinct genomic EcoRI fragments from chromosome I This submission contains the sequence from the EcoRI site at position 181919 to position 285516 (left end) of our previous phase II submission. This fragment contains the AXRI locus and the marker YUPBH12L.  YUPBH12L. (YUPBH12L.) AUTHORS Theologis, A.		Street, Albany, CA 94710, USA 5 bases 1 to 103576) Theologis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               haloperoxidase genes can be used for the recombinant production of the enzyme. The haloperoxidases of the invention are vanadium-dependent and have halide specificity of bronde and iodine:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence
                                                                                                                                                                                                                                                                                                         A CONR sequence (10387) codes for a chloroperoxidase (R82149) of Curvalaria inaequalis. The conk was obtd. by PCR using primers based on known sequences of the gene and by 5'RACE. The approtein encoded by the CDNA can be reactivated by addn. of vanadate. The cDNA can be reactivated by addn. of vanadate. The CDNA can be reactivated by addn. of vanadate. The CDNA can be the recompliant of vanadate into a vector for expression in procaryotic host cells. The recombinant chloroperoxidase is utilised in hailde (sep. chloride) analysis, or as an environmentally-friendly antifouling
                                                                                                                                                                                                                              Use of halo:peroxidase enzymes - in antifouling paints and methods for determining the halide concn. of liquids Example 3: Flg 6; 48pp; Erglish.

T1356-731 show open reading frames 13, 20, 22-30, 32, 38, 41-46, 50-60, 62-63, 66, 66-79, 81-87, 91-92, 96-88, 101-103, 106-127, 129-130, 140-146, 148-150, 152 and 154 from a total of 154 ORFs identified in the Autopraphs californica nuclear polyhedrosis virus (AcRPO) clone 6. Each gene is numbered according to lits position in the virus genome beginning at the left end of the linear map; and irrespective of its orientation. The direction of transcription is relative to that some of the Polyhedrin gene. Of the 154 ORFs identified it was found that some of the ORFs (ORFs 27, 30, 32, 71, 86, 123, 126 and 127) are dispensable for virus replication in cell culture or insect larvae. These genes can be deleted from the genome to: (a) provide additional sites for insecting single or

5'-phosphate ester from the corresponding nucleoside when a phosphate donor, e.g. poly-, phenyl- or carbanyl-phosphoric acid, is reacted in its presence at µi 30 to 5.5. The PA can be used for the economic and efficient production of nucleoside 5'-phosphate esters for use as condiments, pharmaceuticals and intermediates for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Efficient production of nucleoside 5'-phosphate - by reaction of a nucleoside with a phosphoric acid donor in the presence of an acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Xample 24; Pages 74-75; 95pp; Japanese.
The present sequence encodes the Serratia marcescens IAM 13540
acid phosphatase (AP), which can be used to produce a nucleoside
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             33304 .. -phosphate esters. The method comprises reacting a nucleoside with hosphate donor at pH 3.0-5.5 in the presence of an acid phosphatese at hose been altered to increase its affinity for the nucleoside and/or increase its thermal stability, or in the presence of a microorganism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        that has been transformed with recombinant DNA containing a gene coding for such an acid phosphatase. Nucleoside 5' phosphates are useful as seasonings or pharmaceuticals or as intermediates for them note: this sequence appears to be claimed (claim 6), but as the claim protein is being claimed.
